CIE1 Component - Project Overview

Fauna Robotics Inspired Landing Page

This project was built as a front-end web application inspired by the Fauna Robotics homepage. It demonstrates how a modern website can be created using HTML, CSS, and JavaScript while following the learning modules covered in the IBM Web Development certification course.

Project Goal

The aim of this project was to recreate a modern robotics landing page with sections like the hero banner, feature explanation cards, technology highlights, product-related calls-to-action, and a footer. The design focuses on a clean, professional startup aesthetic and responsive layout.

1. Core Components Used in the Web App

Header and Navigation: Contains the brand name, menu links, video button, and Request Robot CTA.

Hero Section: Displays the main headline, tagline, and trust bar with partner names.

Video Showcase Block: A visual preview area for product presentation and video call-to-action.

Feature Cards: Highlights the product value for developers, enterprises, and researchers.

Platform Section: Explains the product capabilities in a structured and readable way.

Application Cards: Represents sectors like retail, consumer, research, and entertainment.

About / CTA Section: Reinforces the company mission and encourages user action.

Footer: Contains company information, social links, and legal links.

2. Topics Covered from the Course

HTML5 Structure: Semantic elements such as header, nav, main, section, article, and footer were used to organize the page structure.

CSS Styling: Fonts, colors, spacing, borders, shadows, gradients, buttons, hover states, and layouts were created with CSS.

Responsive Web Design: Media queries were used so the layout adapts for tablet and mobile screens.

JavaScript Interactivity: Event listeners were used for menu toggling and button interactions.

Layout and Positioning: Flexbox and CSS grid were used to create balanced and modern page layouts.

Visual Hierarchy: Typography, spacing, and section sizes were used to create a clean design flow.

Accessibility Basics: Semantic HTML and clear headings help improve readability and usability.

Website Testing and Deployment: The page was verified locally and is ready for deployment on a hosting platform such as GitHub Pages or Netlify.

3. Where Each Topic Is Used in the App

Header and navigation in the top area are created using HTML nav elements and styled with CSS for layout, spacing, and responsiveness.

The Hero section uses large heading text, call-to-action buttons, and branding text to form the first impression of the website.

The Feature Grid uses CSS cards to present the product information in a structured way, making it easy to understand the value proposition.

The Application section showcases real-world use cases using reusable card components with consistent formatting.

JavaScript is used to toggle the mobile menu and manage simple click interactions for the action buttons.

The footer groups company links, social media links, and legal links using semantic HTML lists and a minimal styled layout.

Responsive design is applied in CSS media queries so the website remains visually stable across different screen sizes.

4. Presentation Summary

This project shows the full lifecycle of a simple modern website: planning the structure, designing the interface, adding interaction with JavaScript, and preparing it for deployment. It is a strong example of how the core modules from the IBM Web Development course can be applied in a real-world assignment or portfolio project.

Files used in this project:

- index.html ? main page structure
- style.css ? styling, layout, responsiveness
- script.js ? interactivity and menu logic
- IMPLEMENTATION_PLAN.md ? project planning documentation
